

Odor Neutralizing System

True Odor Neutralizing Systems

A proprietary blend of all natural and bio degradable ingredients is injected into our high pressure fog system and billions of atomized droplets attach to and eliminate noxious odors, such as the pungent odor associated with flowering marijuana, solid waste treatment or microbial decomposition.

How it Works?

- High pressure fog is achieved through an atomizing process via a high pressure fog pump and specialty fogging nozzles that produce billions of micron sized droplets.
- Nozzle ring is installed on the exterior of any vent or duct allowing the fog to mix with exhausting air.
- Specially formulated neutralizing solution (Odor Armor®) is injected into the fog, completely mixing with airborne odors. A series of chemical and physical reactions modify the structure of the odor, not merely masking but eliminating the odor.

Benefits:

- Neutralizes odors, which eliminates complaints, violations and expensive fines
- Licensing and application process approvals
- Maximum coverage with minimum investment
- Non-toxic and biodegradable with no contamination
